Professional Summary

Adversarial Engineer turned Defender. Architect of high-throughput distributed systems processing **2M+ daily requests** in hostile environments. Deep expertise in reverse-engineering Layer 4/7 rate-limiting logic and building **Zero-Trust** forensic platforms. Engineered a \$500k ARR system bypassing commercial WAFs before pivoting to build compliant, cryptographic evidence vaults using **OpenTelemetry** and **Blockchain** verification. Bridging signal processing logic with network security to detect behavioral anomalies.

Technical Arsenal

Core Competencies: Distributed Systems, Anti-Bot Evasion, Digital Forensics, Chain of Custody, Traffic Shaping, High-Availability Architecture, RFC-Compliant Security.

Languages & Stack: Python (AsyncIO/Django DRF), Node.js, Bash, SQL (PostgreSQL), Celery (Distributed Queues), Redis, C++.

Infrastructure: Docker, Kubernetes, Residential Proxy Networks, Nginx Load Balancing, PKI/Digital Signatures (X.509/PKCS#7), Linux Hardening.

Security & Analysis: OpenTelemetry (Distributed Tracing), Packet Inspection (Wireshark), TLS Fingerprint Spoofing (JA3), OCR (Tesseract/Mistral).

Engineering Experience

X Lead Scraper (SaaS)

Founder & Lead Architect

Remote

2024–Present

Architected a distributed intelligence platform generating \$500k ARR in 6 months via adversarial engineering.

- **High-Scale Traffic Engineering:** Designed "Hydra," a custom request router utilizing **Round-Robin Proxy Rotation** across **1,200+ residential IPs** and 47 endpoints to process 2M+ requests/day, achieving 99.9% uptime against active countermeasures.
- **Layer 4 Security Analysis:** Reverse-engineered X's (Twitter) anti-scraping logic, identifying detection vectors based on **TCP/IP fingerprinting** and co-temporal activity graphs rather than simple volumetric limits.
- **The Compliance Pivot:** Re-engineered the stack for **Network Isolation** and implemented "Human Pattern Mimicry" (randomized jitter, mouse-movement simulation) for organic behavioral compliance.
- **Intent Analysis Engine:** Built a proprietary NLP scoring pipeline (BERT models) to grade lead quality, shifting the business model from raw data volume to high-intent semantic targeting.

ExitProtocol

Lead Security Architect

Remote

2024–Present

Forensic security platform protecting assets in high-stakes litigation via cryptographic evidence management.

- **Secure Evidence Vault:** Architected a **Zero-Trust** storage system using **AES-256 encryption** and **PDF Digital Signatures** (pyHanko) to ensure non-repudiation and court-admissible chain of custody for digital artifacts.
- **Distributed Forensics Engine:** Implemented the "Lowest Intermediate Balance Rule" (LIBR) algorithm using **Celery** for asynchronous processing of massive financial datasets, ensuring auditability of commingled funds.
- **Multi-LLM Orchestration:** Deployed a hybrid AI pipeline (Mistral/Google Gemini) for automated document classification and OCR, achieving 99% accuracy in extracting financial data from unstructured legal PDFs.
- **Observability Compliance:** Integrated **OpenTelemetry** for end-to-end distributed tracing, enabling granular auditing of every user action and API call to meet strict legal compliance standards.
- **OpSec Anomaly Detection:** Built "Protocol 0" duress systems and graph-based fraud detection (**vis.js**) to uncover hidden asset structures and obfuscated transfers.

Technical Publications

Nov 2025: "The \$500K Mistake: A Technical Post-Mortem on Layer 4 Network Detection"

Education

National Institute of Technology (NIT)

Bachelor of Technology in Electronics & Communication

Mizoram

2017–2019

Left prior to degree conferral to pursue practical engineering challenges in the high-growth SaaS sector.
