

Vinay Kumar Gond

Backend & Full-Stack Product Engineer · Python / Django

India · vinay@exitprotocols.com · vinaygond.github.io
github.com/Vinaygond · linkedin.com/in/vinaygo

PROFILE

Python and Django engineer building data-intensive products across backend services, review interfaces and delivery workflows. Founder of Exit Protocol, an evidence-linked financial investigation platform. Focused on explicit review state, reproducible calculations, source provenance and regression-tested behavior.

TECHNICAL SKILLS

Backend & data: Python, Django, PostgreSQL, SQL, Decimal, Celery, Redis.

Interfaces & delivery: JavaScript, HTML/CSS, Django templates, Docker, Git, GitHub Actions.

Testing & integrations: unittest, Django tests, Playwright, OAuth-based workflows, PDF processing, SHA-256 file verification.

ENGINEERING EXPERIENCE

Exit Protocol — Founder & Engineer

2025–present · Independent product development · exitprotocols.com

- Built a Django document-production workflow with source-file/page accounting, proposed document boundaries, account/period metadata and explicit reviewer decisions.
- Developed a financial-record workspace connecting account coverage, source inspection, recorded transactions and Decimal-based statement-reconciliation controls.
- Separated transfer proposals from reviewer-confirmed relationships and read-only movement projections, preserving case-scoped access and authority boundaries.
- Implemented bounded deterministic LIBR workpapers with preserved inputs, source references and exact-file SHA-256 verification; calculations remain separate from professional interpretation.
- Built regression and browser checks around review workflows, permissions and numerical behavior, with PostgreSQL concurrency coverage and CI release gates.

Hydra / XLeadScraper — Founder & Builder

Prior independent venture · Historical project

- Built a commercial data-automation workflow involving asynchronous request orchestration and structured lead processing.
- Documented a platform-enforcement failure and the implications of shared infrastructure, authorization constraints and customer risk in an engineering postmortem.

SELECTED PUBLIC WORK

LIBR state-machine demo: dependency-free Python reference implementation with synthetic fixtures, regression tests and reproducible CLI/JSON outputs. Bounded calculation model, not a legal opinion.

Project case studies: implementation decisions, review boundaries and lessons from platform dependency failures.

EDUCATION

National Institute of Technology Mizoram · 2017–2019

Undergraduate coursework in Electronics & Communication; degree not completed.
